The nucleic acid coding for CACNAIG is useful as a marker for screening concer and age related diseases. A diagnostic kit containing primers (CASO1574-AASO1623) for amplification of a CpG-containing nucleic acid, where the primer hybridises with a target polynucleotide sequence (CASO1677-AASO1673), can be used for detecting aberrant methylation. The CC cpG island sequences (AASO1677-AASO1672) are selected from genes encoding CC CACNAIG, apolipoprotein B (APOB), caudal type homeobox transcription factor 2 (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1 (CC (HSN1), G protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B: HSPA6), RasGAP-related protein (IGGAP2), klotho (KL), CC (HSP70B: HSPA6), RasGAP-related protein (HSPA6), RasGAP-related pr

                                                                                                                                                                                    cellular proliferative disorders e.g. leukaemia, colorectal, lung, brea and other cancers. The nucleic acid coding for CACNAIG is useful as a marker for screening cancer and age related diseases. A diagnostic kit containing primers (AASO1574-AASO1623) for amplification of a CpG-containing nucleic acid, where the primer hybridises with a target polynucleotide sequence (AASO1627-AASO1676), can be used for detecting aberrant methylation. The CpG island sequences (AASO1677-AASO1692) are selected from genes encoding CACNAIG, apollpoprotein B (APOB), caudal type homeobox transcription factor 2 (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1 (FBNI), G protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B', HSPA6), IOGAP2, klotho (KL proteinase-activated receptor 2 (PAR2), paired-like homeodomain transcription factor 2 (PITX2), patred-like homeodomain
                                                                                                                                                                                                                                                                                                                                                                                                                              5'-target sequence (complementary to the 5'-bisulfite PCR primer) is used to study the methylation state of IQGAP2 which maps to chromosome 5q. The methylation state of specific regions within CPG islands associated with a novel T-type calcium channel CACNAIG gene correlate with several cancerous phenotypes involving various tissue and cell types. Since aberrant methylation of normally unmethylated CPG islands is often observed in immortalised and transformed cells, CACNAIG is implicated in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule for use as a marker for screening cancer, comprises the coding region for a \mathbb{T}-type calcium channel and regulatory sequences associated with the channel -

          This 5' primer is used with a 3' primer (see AAV07939) in the PCR amplification of Helicobacter, e.g. Helicobacter pylori, genomic DNA in order to obtain DNA (see AAV07916) encoding the unprocessed form of a 76 kDa polypeptide (see AAV073027) designated GHPO 896. The isolated polynucleotide, and encoded polypeptide, can be used
                                                                                                           New isolated Helicobacter polynucleotides - for the diagnosis, prevention and treatment infections and gastroduodenal diseases
                                                                                                                                                                                                                                                   01-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2655/c
AAT42655 standard; DNA; 29 BP
                                                                                                                                                                         Compositions containing neutralising antitoxin against one or more E. coli verotoxin (VT) can be used to treat intoxicated adults and children with enteric bacterial infections. They may also be used as prophylactics e.g. as a vaccine, against diarrhoeal disease or the development of extra-intestinal complications of E.coli infection, especially haemolytic uraemic syndrome. The antitoxin can also be used to detect E. coli VT in a sample. The VT is recombinant, preferably a fusion protein containing a non-VT protein sequence and part of the E.coli VTI or VT2 sequence. Two primers (AAT42655) were used to amplify the verotoxin VT-1 A subunit coding
                                                                                                                sequence and add a histidine tag coding sequence to the subunit sequence. Two primers (AAT42655, AAT42658) were used to amplify the verotoxin VT-1 A and B subunits and add a histidine tag coding sequence to the subunit sequences.
                                                                                                                                                                                                                                                                                                                                                                           Compsn. contg. neutralising antitoxin against E.coli vero-toxin used to treat intoxicated individuals, and as a prophylactic aga diarrhoeal disease or extra-intestinal complications of E.coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Verotoxin; haemolytic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          E. coli verotoxin (VT) type 1 and 2 subunits A and B were cloned into CC pET-23b, designed to allow expression of the native proteins containing CC c-terminal polyhistidine tags. The VT-1 and VT-2 genes were engineered CC to convert the signal sequence methionine codon into a NdeI site to convert the signal sequence methionine codon into a NdeI site to CC end convert the signal sequence methionine codon into a NdeI site to CC entroided amino acids. The C-terminal primers comprises the CC c-terminal T codons of each gene fused to the sequence CTCGAGCC, in order to add the polyhistidine tag. The primers delete the native stop codons, CC and when cloned into pET-23 add a C-terminal attension of Leu-Glu-(His)6. CC and when cloned into pET-23 add a C-terminal extension of Leu-Glu-(His)6. CC tag facilitates single step affinity purification of subunits from CC periplasmic extracts. However, due to poor recovery of his-tagged VT-1 A chains, expression of maltose binding protein (MBP) fused control to control to control to control to the total type of the VT-2 B subunit.
                                                                                                                                                                                                        claimed. The vector is chosen from pET24hisVT2BL+, pET24hisVT2BL- and pET24VT2B, where "L+" indicates that the vector encodes the preprotein form of the protein and "L-" indicates that the vector encodes the mature form of the protein. The bacterial cell is capable of expressing large quantities (40 mg/l) of VT-2B. The toxins are useful for immunizing non-mammals and for detecting bacterial toxins in environmental samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           strict uninduced promoter control is necessary to permit cell viability. Bacterial host cells expressing a recombinant expression vector encoding a polyhistidine affinity tag and a polyhistidine aff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacterial cell for recombinantly expressing bacterial toxins in large quantities useful for immunization and treatment of bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant production; so primer; polyhistidine; ss.

                                                                                                                                                                                                                     A single-stranded DNA (or its complementary strand or the corresp. C double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the G'-end of mRNA by using poly(T) as the sole primer. Since the 3'-c untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

The information obtained from nucleic acid analysis by the method described is useful in diagnosis or monitoring of diseases like cancer, inflammation, heart disease, CNS diseases, and susceptibility to infection by microorganisms. In addition, the nucleic acid segments are useful in manufacturing medication in the treatment of prophylaxis of diseases, and also the use of the DNA segments as pharmaceutical.

The primer is used for amplification of the E. coli verotoxin (VT) gene. The oligonucleotide is useful for detection of inactivated VT gene by transfer of a foreign DNA fragment. Simple, rapid and specific amplification of VT gene from environmental factors is achieved using oligonucleotide of the invention.

The delta-stxA allele was integrated into delta-guab-A of delta-guab-A, delta-virG S. dysenteriae 1, which inactivated the shiga toxin of this strain. The mutant can be used in the preparation of vaccines such as, a live vector vaccine comprising a Shigella mutant, (which encodes and expresses a foreign antigen, and a pharmaceutically acceptable carrier) or a DNA mediated vaccine comprising the Shigella mutant (which also contains a plasmid which encodes and expresses a foreign antigen in a eukaryotic cell). The vaccines can be used against Shigellosis.

Examples of tospoviruses include the tomato spotted virus and the Impatiens necrotic spot virus
                                                                                                                PCR primers given in AAQ62951-52 were used to clone anti-glycophorin antibody 1C3 Fab coding region. The DNA sequence of the first 1443 bases of the Fab fragment in pHFA, ready for ligation post PCR amplification for ligation into p569, is given in AAQ62958.

AAF55449/c
ID AAF55449 standard; DNA;
                                                                                                                                                                                                                                                                                                                                 EIB sequences, but having at least the E2B and/or E4 sequences encoding products essential for adenoviral replication. Compared with previous vectors, the new recombinant vectors are replication defective and capress the remaining viral genes only at background levels. The vector itself does not dominantly elicit a response of the immune system, but the immune response is directed primarily against the transgene product, and is less toxic to the cells which, in turn, results in a prolonged synthesis of the protein of interest. The recombinant adenoviral vectors are used in the functional characterization of gene products in vivo, and for overexpression of known and novel genes in cells lines, tissues or animals in order to find genes that encode for proteins with a desired function such as those that interfere with cell proliferation and differentiation. The vectors are further used as captage of the provide sharpsy, and for protein production in mammalian cells. Oligonucleotides AAF55449-50 were annealed together, and used to construct a shuttle vector which was used in the method of the invention.
                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                             adenovirus-like gene delivery wehicle having reduced expression of CC adenoviral E2B and/or E4 gene products in a target cell. The method CC comprises generating a recombinant adenoviral vector lacking E1A and CC E1B sequences, but having at least the E2B and/or E4 sequences encoding products essential for adenoviral replication. Compared with previous CC vectors, the new recombinant vectors are replication defective and CC express the remaining viral genes only at background levels. The vector itself does not dominantly elicit a response of the immune system, but the immune response is directed primarily against the transgene product, and is less toxic to the cells which, in turn, results in a prolonged CC synthesis of the protein of interest. The recombinant adenoviral CC vectors are used in the functional characterization of gene products in vivo, and for overexpression of known and novel genes in CC cells lines, tissues or animals in order to find genes that encode for proteins with a desired function such as those that interfere with cell constructs in order to find genes that encode as CC vaccines, in gene therapy, and for protein production in mammalian cells: Oligonucleotides AAF55449-50 were annealed together, and used to construct a shuttle vector which was used in the method of the invention.

The element is responsible for avoiding or reducing neutralising activity against adenoviral elements by the host to which the gene is to be delivered. The vehicle can be used to deliver genes of nucleic acids of interest to host cells. Use of the delivery system efficiently transfers genetic material to a human cell without the inherent problem of pre-existing immunity, found with previous serotype

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
```

AAZ65654 to AAZ69578 represent human biallelic markers from the pre-invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ74040 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
Best Local Similarity
                                                                chosen absolute number of variations. (A), and analysis of their sequences, are useful for the following: (i) determining a predisposition to disease, especially colorectal, endometrial and ovarian carcinoma and leukemia; (ii) determining an increased mutation rate (frequency of base substitutions, insertions and/or deletions) in eukaryotic cells; (iii) predicting the progression, severity and survival time of patients with neoplastic disease; (iv) the development of therapeutic and 'life-style'
                                                                                                                                                                                                   This invention describes a novel method of determining a predisposition to disease by genotyping a subject's DNA sequence (A) of the human mismatch repair gene, MSH6 at specified positions and comparing with
                        drugs; (v) predicting individual differences in response to known chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv); (vi) optimizing individual treatments and interventions against
                                                                                                                                                                      reference DNA sequences, optionally taking into account all possible combinations of variations of the individual mutations, including an
                                                                                                                                                                                                                                                                                     Novel variants of the human mismatch repair gene, MSH6, useful e.g. determining predisposition to cancer and for development of drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses effects from pharmaceutical agents acting on a disease as verificated agents.
                                                                                                                                                                                                                                                                                                                                                                Plaschke J,
                                                                                                                                                                                                                                                                                                                                                                                                                          06-MAR-1999;

               of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBp]-2 or IGFBP], which is capable of inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, runa, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the such as a neovascular condition of the skin, a hyperneovascular condition such as a neovascular condition of the such a

                                      inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other
                                                                                                                                                                         The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation,
                                                                                                                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an a nucleic acid that inhibits or reduces growth factor mediated

                                                                                                                                                                                                                                                                                                                                         receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neeplasias, scleroderma, warts, benign growths, cancers of the trian abundance of the process of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                 skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other buscase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                           50 kilobases in length. The complex also comprises one or more polypeptides selected from a cell recognition domain, a protein transduction domain, a protein degradation domain, an intracellular targeting domain, a protein interaction domain, an epitope domain and a protein purification domain. The complexes are used to deliver a nucleic acid to a cell. The nucleic acids delivered are of various sizes and preferably greater than 50 kilobases, especially more than 100 or more than 200 kilobases in length.
                                                                                                                                                                                                                                                  AAA57752-66 represent sequences which are bound by the Z2 domain of the human RIF60 polypeptide. RIF60 is a zinc finger protein. The nucleic acid binding domain of the RIF60 polypeptide is used to construct a non-viral nucleic acid delivery complex comprising a modular polypeptide. The complex comprises a modular peptide containing a nucleic acid binding domain and a nucleic acid condensation domain that bind with and condense a nucleic acid molecules.
                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                        molecule into a cell comprises a modular polypeptide

The luciferase was then expressed using E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant Renilla luciferase polypeptide - used as a luminescent tag, partic in bio-luminescence assays and for the prodn of antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         \label{localization} \mbox{Luciferase; enzyme; bioluminescence; luminescence; label; DNA probe; antibody; oligonucleotide; ss. \\

```

O

XSSSSSSSXXX

The present sequence encodes the beta-2 toxin of Clostridium perfringens type C. The specification describes the Clostridium perfringens beta 2 toxin gene promoter (see AAX60300). The sequences can be used to produce vaccines against Clostridium, and especially Clostridium perfringens, or Clostridium

                                                                                                                                              AAX20248 to AAX20402 represent polynucleotide sequences isolated from Borrelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as

                                                                                                                                                                                                                                                             CC invention relates to 43 novel human secreted proteins (AMU01040)-AMU01082)
CC and their gene sequences which can be used in gene therapy. The secreted condition or useful to prevent, treat or ameliorate a medical condition condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptibility to a pathological condition. Antibodies to condition or susceptible conditions associated conditions and disorders which are diagnosed conditions or suspenditions or system disorders e.g. cardiac arrest, cerebrovascular disorders e.g. conditions caused by bacteria, viruses and fungi and coular disorders e.g. corneal infection. The polypeptides can also be condition or suspendition, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities.

                                                                                                                                                                                                                                                                  homology to mammalian PDK. A number of C. elegans genes have been identified as homologues of genes in the mammalian insulin signalling pathway. The C. elegans age-1 gene encodes a homologue of the mammalian PI 3-kinase whilst daf-2 encodes a homologue of the mammalian receptor. The C. elegans AKT kinase and PKB kinase act downstream of daf-2 and age-1, just as their mammalian homologues act downstream of insulin signalling. The C. elegans PTEN lipid phosphatase homologue, DAF-18, has been found to act upstream of AKT in the pathway. This discovery has enabled mammalian PTEN action to be mapped to the insulin signalling pathway. Conserved DAF motifs can be used to design probes to identify mammalian DAF homologues and thus to identify individuals with a predisposition toward the development of glucose intolerance
                                                                                                                                                                                                                                                                                                                                                                                                                                                             elegans. It encodes two are homology to mammalian PDK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing and treating obesity and impaired glucose tolerance using modulators of daf-18 expression and/or activity - \,

                                                                                                                                                                                                                                         The present sequence encodes a species-specific Plasmodium vivax malarial antigen, PVESP-1. The gene appears to be missing a small portion of its 5' end. This protein is secreted into the plasma of a susceptible mammalian host after infection. Monoclonal/polyclonal antibodies can be utilised in assays used to diagnose malaria, as well as to determine whether P. vivax is the species responsible for the
                                                                                                                                                                                                          Sequence 3337 BP; 1304 A; 467 C; 875 G; 691 T; 0 other;

                                                                                                                                                                                      The protein comprises an epitope not present in other Plasmodium species that cause malaria in humans, and is bound by monoclonal antibody 1011G10. The peptide antigen can be used in immunoassays for diagnosis of malaria caused by P. vivax and/or can be used to produce antibodies
                                                                                                                                                                                                                                     The present sequence encodes a C-terminal erythrocyte secreted protein-1 (pvESP-1) of Plasmodium vivax. PvESP-1 is a malarial antigen which is a secreted blood-stage protein present in detectable amounts in biological samples from individuals infected with P. vivax.

                                                                                                                    The invention relates to novel species-specific Plasmodium vivax malarial peptide antigens which are proteins or fragments of proteins secreted into the plasma of a susceptible mammalian host after infection, and to monoclonal or polyclonal antibodies directed against those antigens. The peptide antigens, monoclonal antibodies, and/or polyclonal antibodies are useful in assays to diagnose malaria, and to determine which P. vivax species is responsible for the infection. The present sequence encodes P. vivax erythrocyte secreted protein-1 (PESP-1), a secreted species-specific blood stage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exon
                                                                                     Sequence 3337 BP; 1304 A; 467 C; 875
                                                                                                           antigen provided in the invention.
                                                                                                                                                                                                                                            Example 4; Fig 5; 23pp; English.

The RIN and MC genes are used in genetic transformation techniques to manipulate a variety of plant characteristics. Hence these genes represent a valuable new tool for the creation of transgenic plant preferably having one or more added beneficial characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
